

Sustainability Policy

Our business will be characterized by a sustainable approach. We take responsibility for the impact of our operations on society, which for us primarily means spreading knowledge and expertise about our testing services, with the aim of influencing our customers to develop and manufacture sustainable and profitable products.

We contribute to reducing the climate footprint of our business.

We continuously work with our plan that will reduce our climate impact and reach our goal of climate neutrality in 2045.

We contribute to better use of our resources.

We continuously work with preventing, reducing, reusing and recycling our waste. We also work with responsible handling of chemicals to reduce negative consequences for human health and the environment.

We contribute to a safe and attractive workplace.

We continuously work to make our workplace attractive for future and existing employees. Our employees can develop and increase their competence and expertise.

We contribute to a local society.

We will contribute to activities where children can have meaningful leisure and where young people's education and practice are promoted. We will also participate in various collaborations with associations and schools.

We contribute to sustainable innovation.

By developing sustainable solutions, which for us means new testing services and increased market shares, we contribute to our customers' sustainability work.

We contribute to sustainable growth.

With a profitable business, we can continue to invest in new technology, equipment, and new services and most important, invest in the skills development of our employees.
